when conducting scientific research in any field it is not sufficient to simply design thoughtful and informative experiments to explore ideas and hypotheses the experiments must be conducted in such a manner that the data generated effectively address the ideas and hypotheses under study collecting good data necessitates the use of good methods techniques and instrumentation behavioral neuroscience is most certainly a field that over the years has required novel inventive and effective methods and tech niques to collect data on a rather difficult subject namely how the brain and nervous system encode behavior perhaps one of the most interesting things about the field of behav ioral neuroscience is that most scientists in this field are engaged in a variety of activities it is not always the same

boring routine the rule not the ex ception in this field is that investigators are trained in a variety of techniques and skills this work requires knowledge of skills in such diverse tech niques as surgery animal training basic electronics computer programming statistics and histology as well as having a good theoretical background knowledge of the relevant literature and the creativity and logic necessary to design and execute critical experiments one does not have to be an expert in all of these skills and conversely not all skills require an expert

with over 300 training programs in neuroscience currently in existence demand is great for a comprehensive textbook that both introduces graduate students to the full range of neuroscience from molecular biology to clinical science but also assists instructors in offering an in depth course in neuroscience to advanced undergraduates the second edition of fundamental neuroscience accomplishes all this and more the thoroughly revised text features over 25 new material including completely new chapters illustrations and a cd rom containing all the figures from the text more concise and manageable than the previous edition this book has been retooled to better serve its audience in the neuroscience and medical communities key features logically organized into 7 sections with uniform editing of the content for a one voice feel throughout all 54 chapters includes numerous text boxes with concise detailed descriptions of specific experiments disorders methodological approaches and concepts well illustrated with over 850 full color figures also included on the accompanying cd rom
